

Summary

Communication Unit

The invention relates to a communication unit (3) with a memory (10) for storing data relating to possible communication partners [(2)], a connecting device (11) for establishing communication connections with a communication partner (2) by way of different means of communication and a control unit (9) for triggering the connecting device (11) in order to establish a communication connection utilizing the data that is stored in the memory (10) and/or that can be entered manually. A communication unit according to the invention is characterized by the fact if establishing a connection fails, the control unit (9) triggers the connecting device (11) in such a way that a communication connection is established with another means of communication.
